How Mold Blocker Works

Molds reproduce by means of tiny spores; the spores are invisible to the naked eye and float through outdoor and indoor air. There are approximately 10,000 mold spores on the head of a pin.

1 Mold spores land on fabrics and surfaces that are wet and begin to grow.

2 A mold blocker creates an invisible barrier that mold and mildew can't penetrate.

3 If mold is prevented from growing there is:

- Less time spent on cleaning mold.
- Less potential damage to your home and office
- More time to spend with family and friends

For more information go to the Prevent section in this brochure or call our customer service technicians to assist you with your questions.
